PROBLEM STATEMENT

To identify the letters of the sentence written by the user in their devices and to convert the handwritten text into digital format.

What does this problem focus on?	This problem focuses on real time a novice customer that attempts to bridge them with the banking services in a customized manner based on their interests and activities.
When does this occur?	The banking applications these days are working fine and make almost all the banking routines with ease. Yet, these interfaces were either flooded unwanted notifications or missing the spotlight information for the particular customer.
Why do we need this?	To enable the e-banking services as a customer based preferential service.
How to do this?	Instead of promoting regional ads, AI can be deployed to navigate to their interest and customize the entire app according to the customer priority.
Where it is used?	It shall be deployed as a quality update in all the banking apps.
